

Food Industry Nets

Food Industry Nets

EXPO-NET's extruded nets are manufactured in our factory in Denmark to BRC standards.

Our nets for the food industry are used for many different applications within cheese dairies, smokehouses and in the restaurant/bar sector.

Smokehouse Nets

Type 43A is used as a smokehouse net. The net can be used for both cold and hot foods, for example fish and meat.

When using our nets, the huge advantage is that the smoked product does not get stuck on the "net grid", therefore avoiding marks appearing and the fish or meat are not damaged when you lift the smoked product off the net.

The net is available in rolls and pre-cut pieces.

Cheese nets

Nets for cheese dairies are utilised in the cheese production process. Different types of nets are recommended depending on the application and type of cheese.

The large hard cheeses are laid on shelves with a highly profiled net (type 43A) to create ventilation and therefore good storage conditions. The net allows for full process circulation. It is also possible to stack the cheeses in several layers if a net is placed between each layer.

Fine-meshed nets (types 103 and 106) are used for separating soft cheeses in salt boxes, so that it is possible to process several layers of cheese at the same time. The fine-meshed nets ensure minimal marking to the cheeses, and the lower thread in the net ensures maximum ventilation.

Bar liners

The bar liner can be used for many different purposes. The traditional application is as a slip-resistant bar liner. In addition the product can also be used to line drawers and shelves in restaurants.

The strong temperature resistant net can also be used in dish-

washers where it ensures that glass and crockery do not move around.

The net reduces chip damage to glass and crockery and because of the special mesh structure it prevents condensation after washing.

The product can be impregnated with an antibacterial agent reducing harmful bacteria and unpleasant odours.
